Regression Model Development and Computational Procedures to Support Estimation of Real-Time Concentrations and Loads of Selected Constituents in Two Tributaries to Lake Houston Near Houston, Texas, 2005-9: Usgs Scientific Report 2012-5006

By Michael T. Lee

BiblioGov. Paperback. Book Condition: New. This item is printed on demand. Paperback. 50 pages. Dimensions: 9.7in. x 7.4in. x 0.1in. In December 2005, the U. S. Geological Survey (USGS), in cooperation with the City of Houston, Texas, began collecting discrete water-quality samples for nutrients, total organic carbon, bacteria (*Escherichia coli* and total coliform), atrazine, and suspended sediment at two USGS streamflow-gaging stations that represent watersheds contributing to Lake Houston (08068500 Spring Creek near Spring, Tex. , and 08070200 East Fork San Jacinto River near New Caney, Tex.). Data from the discrete water-quality samples collected during 2005-9, in conjunction with continuously monitored real-time data that included streamflow and other physical water-quality properties (specific conductance, pH, water temperature, turbidity, and dissolved oxygen), were used to develop regression models for the estimation of concentrations of water-quality constituents of substantial source watersheds to Lake Houston. The potential explanatory variables included discharge (streamflow), specific conductance, pH, water temperature, turbidity, dissolved oxygen, and time (to account for seasonal variations inherent in some water-quality data).

Reviews

Thorough manual for ebook fans. it had been writtarn quite properly and valuable. It is extremely difficult to leave it before concluding, once you begin to read the book.
